

TIME MACHINE 2.0: CLOUD CONTROL MEETS TIME TRAVEL

See the Past. Secure the Present.

Time Machine 2.0 is imPAC's advanced configuration and compliance history engine, now integrated with AWS CloudTrail. Teams can **reconstruct any configuration moment in time** across infrastructure, policies, and violations. Whether prepping for an audit, investigating a breach, or trying to understand drift, Time Machine offers **precise snapshots and diffs** of an environment's evolution backed by real config events and an intuitive timeline interface.

Time Machine 2.0 delivers precise change tracking, audit support, and point-in-time reports to **answer any security or compliance question with "when, what, and who."**

Compare infrastructure state, compliance health, or control coverage between two dates or zoom in on one moment to see exactly what changed, and why.

Business Impact

Prove compliance retroactively with audit-grade snapshots

Investigate breaches faster with timestamped change evidence

Plan rollbacks with detailed diffs of asset and policy state

Monitor config drift and stop silent security regressions
